Going "Under the Hood"

By Chris Gosek

Brian Hammill of Atmel Corporation visited students from the STEM for Kids organization, in a demonstration where he gave the children and up close and personal look at the chips and embedded computers that make everyday devices work as they do.

During Hammill's presentation, the students were shown how the chips help to make their phones work as well as taking a "look under the hood" of a computer. The kids even looked at the inner workings of robots made by East Wake Academy students.
